

ASO AGENT · APP STORE OPTIMIZATION PLATFORM

Research, write and track app store metadata — in one place.

A production web platform for App Store Optimization. Score keywords against live store data, generate publish-ready metadata with AI, and track ranking movements daily — across both the Apple App Store and Google Play.

API ENDPOINTS

One workflow, from keyword to published listing

ASO is usually split across disconnected tools — one for keyword volume, another for rank tracking, a spreadsheet for the copy, and the store console for publishing. ASO Agent puts the whole loop behind a single sign-in, with every score computed from live store data rather than a stale index.

The five core modules

- **Keyword Research** — traffic, difficulty and your live rank for any keyword, in 40 countries, on either store.
- **ASO Writer Agent** — researches competitors, analyses keywords and writes complete store metadata in one pass.
- **Keyword Tracker** — daily rank monitoring per keyword and country, with movement history.
- **Top Charts** — live and cached store charts with day-over-day rank deltas.
- **Review Insights** — mines user reviews for the vocabulary and complaints that should shape your metadata.

Alongside these sit Advanced ASO batch scoring, an ASO Audit, App Search, a Google Play intelligence suite and Connect Publisher for pushing metadata to App Store Connect.

Live data, not a stale index

Keyword scores are computed from current store search results and autocomplete, so a score reflects the store as it is today — not a monthly crawl.

Both stores, one model

App Store and Google Play are scored through the same traffic/difficulty framework, so numbers can be compared across platforms instead of guessed at.

Keyword Research

Type a keyword and get the three numbers that decide whether it is worth targeting: how much traffic it carries, how hard it is to rank for, and where your app currently sits.

Keyword	Traffic	Difficulty	Ranked Apps	Your Rank	Overall	Field
meditation app	68	41	200	#14	Med	Keywords

Insight:

Strong, steady demand with only moderate competition. 200 apps rank for this term, but the top 10 is concentrated among four established publishers — a well-optimised title can realistically break into the top 20.

Single keyword scoring. Live autocomplete suggests the phrasings real users search. Results show traffic and difficulty as scored bars, how many apps compete for the term, your own rank, and — most usefully — a **field recommendation** telling you whether the keyword belongs in the title, the keyword field, the description, or nowhere. A batch tab scores a whole list in one run.

Why the field recommendation matters. App Store ranking weight is not evenly spread: a term in the title carries far more weight than the same term in the description. Knowing which bucket a keyword deserves is the difference between a wasted 30 characters and a ranking gain.

ASO Writer Agent

Describe the app once. The agent researches competitors, benchmarks the charts, scores the keyword space, and returns a complete, positioned set of store metadata.

Target Positioning

Calm is positioned as the clinical-grade sleep and anxiety companion for adults who have already tried and abandoned lighter mindfulness apps. Where competitors lead with streaks and gamification, the strongest available wedge is measurable outcomes — sleep onset time and anxiety reduction — backed by named clinicians. The category leader owns "meditation"; the opening is in "sleep" and "anxiety", where intent is higher and competition is roughly 30% softer.

Keyword Strategy

Anchor the title on "Sleep & Meditation" rather than "Meditation" alone — traffic is comparable but difficulty is materially lower. Push "anxiety relief", "sleep sounds" and "breathing exercises" into the subtitle and keyword field, where they compound without competing with the brand term. Reserve "mindfulness" for the long description; it converts poorly as a head term.

COMPETITORS DISCOVERED

• Headspace

• Insight Timer

• Balance

• Breethe

• Meditopia

TOP CHARTS BENCHMARK

• Health & Fitness — #4 US

• Medical — #2 US

Strategy first, copy second. Rather than emitting text straight away, the agent returns its reasoning — target positioning, an explicit keyword strategy, the competitors it found and the charts it benchmarked against. The **Store Metadata Copy** and **Visual Directions** tabs then hold the publish-ready titles, descriptions and screenshot direction built on that strategy.

Model resilience. Generation runs on OpenAI with an automatic fallback to Groq, so a provider outage or rate limit degrades the run instead of failing it.

Keyword Tracker

Research tells you where to aim. Tracking tells you whether it worked. Keywords are re-checked on a schedule and kept as history, per app and per country.

Keyword Rankings

KEYWORD	RANK	CHANGE	BEST	TRAFFIC	7 DAYS
meditation app	6	↑3	#5	68	
sleep sounds	3	—	#2	61	
mindfulness	12	↑3	#12	55	
anxiety relief	21	↓2	#17	47	
guided meditation	8	↑3	#8	52	
breathing exercises	—	—	—	34	

Movement, not just position. Each keyword shows its current rank, the change since the last check, its best-ever position and a seven-day sparkline — with summary tiles for average rank, how many keywords improved, and how many sit in the top 10. Terms you do not yet rank for stay visible rather than disappearing, so you can see what is still out of reach. Both iOS numeric IDs and Android package names are supported.

ASO Agent — Product Overview

5

Top Charts

Category-level market intelligence: who is climbing, who is falling, and how your own app sits against them — refreshed daily and diffed against the previous snapshot.

Day-over-day deltas. Charts are snapshotted on a schedule and stored, so every row carries its movement since yesterday rather than a position you would have to remember. Results are cached in Redis and persisted to Firestore, which keeps repeat views fast and preserves history for trend analysis. Covers both stores across all supported countries and categories.

Review Insights

Your users have already written your keyword list — it is sitting in your reviews.

Mining reviews for metadata. Pulls recent reviews for any app — yours or a competitor's — and extracts the vocabulary users actually reach for, alongside rating distribution and recurring complaints. Those phrases are frequently better metadata terms than anything brainstormed internally, and the complaint clusters point directly at what a competitor's listing is failing to deliver.

Under the hood

The interesting engineering here is less about the UI than about keeping live store data fast, affordable and reliable enough to build a product on.

Two-tier caching

Store responses are expensive and rate-limited. Upstash Redis absorbs repeat reads, while Firestore persists chart snapshots so day-over-day deltas survive cache expiry.

Provider fallback

AI generation targets OpenAI and falls back to Groq automatically, so a single provider's outage or quota limit degrades quality rather than breaking the feature.

Metered access

Usage is credit-metered per account with rate limiting at the edge, so a single user cannot exhaust upstream store quotas for everyone else.

Scheduled sync

A daily cron job snapshots charts and refreshes tracked keyword ranks, so the data is already warm when a user opens the dashboard.

Stack

Framework	Next.js 16 (App Router), React 19, TypeScript
Styling	Tailwind CSS v4
Auth	NextAuth — Google OAuth, route protection at the edge
Cache / DB	Upstash Redis · Firebase Firestore
AI	OpenAI with automatic Groq fallback
Store data	app-store-client, iTunes RSS, google-play-scraper
Scale	21 pages · 58 API routes · ~22,200 lines of TypeScript

Store data is sourced from public and partly undocumented endpoints; these can change without notice and are monitored rather than assumed stable.
